

1 ABSTRACT OF THE DISCLOSURE

2 The Theory of Bell's Palsy derived from scientific evidences states that there are two
3 types of facial paralysis based on two distinct inciting etiologies wherein a first facial
4 paralysis is caused by a first viral, bacterial, spirochetal or fungal infection, a second
5 facial paralysis is caused by a second vascular etiology associates with cardiovascular,
6 endocrinologic, rheumatologic diseases, trauma or any combination thereof. The second
7 facial paralysis associates with vascular etiology, in general, is more virulent than said
8 first facial paralysis with tendency towards poorer outcomes. Mathematic equations and
9 graphs are also derived. It further provides a process of using medications for treating the
10 inciting infectious, cardiovascular, endocrinologic, rheumatologic and trauma causes.
